FREE-FALL WINDLASS

Automatic Free-Fall System

The **Automatic Free-Fall System** applied to the Balder windlass allows free running of rope through the gypsy when lowering the anchor; simply by depressing the down control button the windlass will release its clutch and the gypsy will freewheel. To stop the Free-Fall depress the up control button on the windlass; the clutch will engage stopping the gypsy and allowing retrieval of the rope. The Free-Fall function can be bypassed to facilitate power controlled release.

Automatic Stop

**Mounting kit
Thru-hull with automatic device**

The **Automatic Stop** kit allows you to automatically stop the anchor on its way up leaving it in its stowed position. The **Automatic Stop** is a simple system composed of a thru-hull fitting equipped with a sensor and a composite shell, that is easily fixed to the leaded rope, equipped with magnets.

The rope will run freely until the magnets don't get in contact with the sensor which again will automatically stop the motor by interrupting the electrical circuit.

The Quick Balder Free Fall windlass is designed for inside/stern installations but may easily be adapted to other type of installations due to its flexible mounting options.

The mounting bracket allows the user to install the windlass in a variety of combinations.

The motorgearbox can be rotated and fixed in several positions every 45°.

Gypsy for rope 12/14/16 mm

The rope-only gypsy has been specifically developed for use of rope at maximum output. The special ribbing allows optimal grip.
