Customizable Yacht Names

CUSTOMIZABLE YACHT NAMES

C&C creates “illuminated names” for the luxury yacht market: completely customizable lights that can be adapted to clients’ requirements and wishes.

Led Stripes

The light source consists exclusively of LED strips that have been specially designed for use in the nautical sector and that are paired with plexiglass, without negatively affecting the refraction of light. C&C uses the latest generation LED strips that cover a colour spectrum ranging from cold white (5000-6000 °K), to warm white (3000-4000 °K), up to RGB that can replicate the whole colour scale.

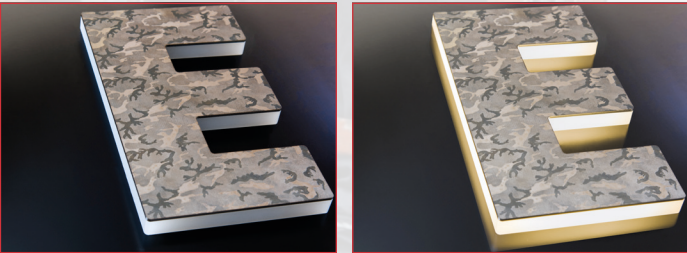

Plexiglass

C&C uses a special type of plexiglass, specially designed to diffuse light from an LED light source. Its internal composition prevents the “hot spot” effect that can be very annoying and unsightly.

Customizable Finishes

C&C offers its clients innovative solutions in metal finishes. By means of electrochemical oxidation, steel can be customized with any 2D texture without altering the physical characteristics of the 316 stainless steel. The oxide layer on the surface remains intact and is actually strengthened.

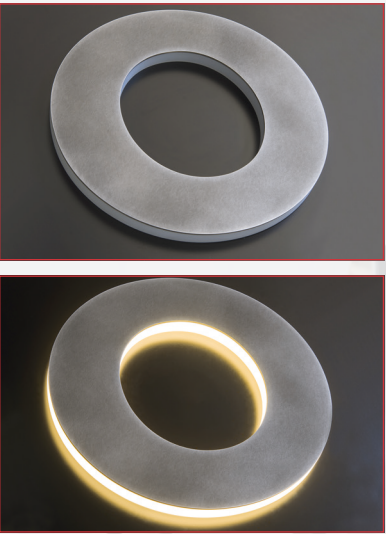

Special Finishes

C&C offers a range of special finishes of the highest quality, giving the original raw material -316 stainless steel - material features that are totally original. Stainless steel owes its name to its special characteristic: invisible to the naked eye a “film” or passive layer is dynamically generated on its surface that protects it from aggressive external agents and ensures that it is highly resistant to corrosion, properties that make this material the best one for use in the nautical sector.

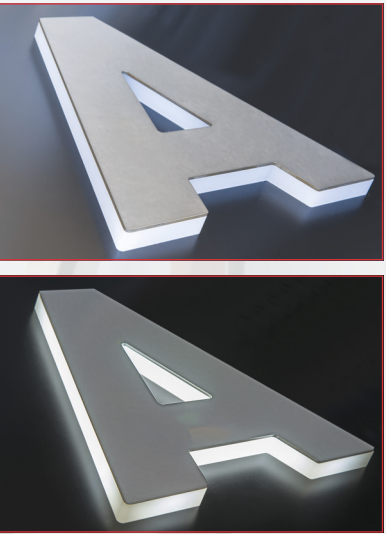

PELTROX

All the strengths of stainless steel with a vintage “lived-in” look with many stories to tell. A finish that looks like pewter, a soft, old-time metal, has been recreated using stainless steel: the result offers the best qualities of both metals.

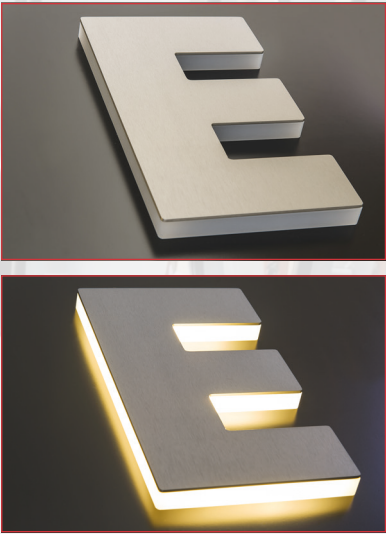

TOUCH

A material finish that is reminiscent of primordial metal. The distinctive feature of its heterogeneous colouration, almost wild, is its strong tactile ‘soft touch’ component that makes it matte and similar to velvet.

PALLADIO SATIN

Gold and silver come together: a colour that recalls a flash of lightning and the rare mineral it is named after. A satin finish enhances its brilliance that reveals all its beauty when light reflects on its surface.

BIOTITE SATIN

This finish is inspired by biotite, a mineral found in igneous rocks. Its very dark colour is similar to bronze, but with a bright heart that is further enhanced by the satin finish of this material.

GOLDEN GLOSS

This finish faithfully reproduces the pure and resplendent colour of gold. The gloss finish enhances its sheen even more.
