

PRESS RELEASE

TSM Systems – Company Information See us on Stand 07.609A in Superyacht Pavilion

TSM Systems is an engineering-led business, developing products for the marine and superyacht industries to help captains manage operations, safety and security. Combining technical and systems expertise with real-world superyacht engineering experience, TSM products address and solve important problems, and are quick to install and simple to use. TSM's strategic partnerships with advanced technology companies and manufacturers around the world provides the company with two proven technology platforms, on which its products are built:

Next generation VHF radio:

- TSM DataTraq units operate across the new VDES marine VHF spectrum, delivering the flexibility to provide privacy, increased range, faster tracking speeds - and even the ability to send WiFi data over VHF
- TowPro is TSM's launch product from this platform, and will be followed with a secure tracker for chase-boats, tenders and jetskis – enabling captains to stay in contact but providing privacy for users who do not wish to be publicly visible

Deep learning vision processing:

- TSM's vision platform combines the company's understanding of photonics and high-performance compact camera systems with tiers of increasingly sophisticated AI tools
- TSM is working on solutions tailored for two critical superyacht operations, where careful vision system design enables greater accuracy from proven deep learning techniques
